Portable laser measurement and calibration

Machine tools and CMM
The ultimate tool for machine tool and CMM verification to international standards

Motion systems
Unique dynamic performance for high speed, high resolution investigations

Research and metrology
Traceable measurement for calibration and research laboratories
Renishaw has been designing, manufacturing and supplying laser interferometer systems for over 20 years. Its ML10 laser system has become a globally recognised standard for accuracy and reliability in use.

The new XL-80 laser system offers greatly increased portability, system accuracy and improved dynamic measurement performance. It is quicker and easier to use, whilst retaining the benefits of a pure interferometry based system; a proven technology that has made Renishaw laser systems the preferred choice of companies worldwide.

XL-80 retains Renishaw’s key virtues of accuracy, reliability and durability in day-to-day use, where it really matters.

Increased performance from the XL laser measurement system widens your measurement options. Significantly smaller than existing systems, it delivers improved portability and ease of use, helping your business to stay ahead.
The basis of the new system is a compact laser head (XL-80) and an independent compensator system (XC-80).

**XL-80 laser**

The XL-80 laser produces an extremely stable laser beam with a wavelength that is traceable back to national and international standards.

The laser frequency stability is specified as ±0.05 ppm over 1 year and ±0.02 ppm over 1 hour. This excellent performance is achieved by dynamic thermal control of the laser tube length to within a few nanometres.

Linear measurement accuracy is an assured ±0.5 ppm over the whole environmental range i.e. from 0 °C - 40 °C (32 °F - 104 °F) and 650 mbar - 1150 mbar. Readings are taken at 50 kHz, with a maximum linear measurement speed of 4 m/s and a linear resolution of 1 nm; even at maximum speed.

As the XL system uses interferometry as the basis for all its measurement options (not just linear), you can have confidence in the accuracy of all your measurements.

With integrated USB there is no requirement for a separate laser-to-PC interface. The laser also features an auxiliary analogue signal output as standard, with quadrature output a factory option. The same socket also accepts a trigger signal input for data capture synchronisation.

LED status lights, indicating laser status and signal strength, provide back-up to the software's “on-screen” indicators. Together with a switchable long range mode (40 m - 80 m) and a warm-up time of less than 6 minutes, these features make the XL-80 quick and easy to use.

An external, switch mode power supply ensures 90 V - 264 V flexibility in input voltage.
Like the XL-80 laser, the compensator is directly connected to your PC via a USB port which, for the XC unit, also supplies power (no separate power supply is required).

The XC-80 weighs only 490 g and together with the XL-80 weighs just over 3 kg (including connecting cables, XL power supply and sensors).

Both the air and material temperature sensors are ‘intelligent’. Integral microprocessors analyse and process the sensors’ output before sending digital temperature values to the XC-80 compensator. This offers more secure measurements and is a key reason why the XC-80 is so compact.

Up to three material temperature sensors can also be attached to the XC-80 compensator to allow linear measurements to be normalised to a standard material temperature of 20 °C.

Sensor cables are 5 m long and detachable for easy replacement. Multiple cables can be screwed together for extended lengths on longer machines.

It then modifies the nominal value of the of the laser wavelength to give a true value, used in calculations, which virtually eliminates any measurement errors resulting from these variations. This can be done automatically, every 7 seconds, as indicated by LED status lights on the XC-80 unit.

Each sensor ‘shuts down’ between readings to minimise heat dissipation; typical of the detail in the XC-80 design, which includes both temperature and pressure mapping of air pressure sensors and coefficient adjusted temperature sensors.

The design of the XC-80 and sensors ensures extremely accurate readings over the full range of operating conditions, from units that are built to withstand the daily handling that most systems will receive.
Tripod and stage

Unless you are using a dedicated measurement rig, then you are likely to need a tripod and stage to adjust the laser's position relative to the desired measurement axis. A new universal tripod has been extensively tested to provide a stable adjustable base in a compact, lightweight unit.

The XL tripod stage allows for precise angular rotation and translation of the XL-80 and is designed to be left attached to the laser unit for easy storage and quick set-up.

Due to careful design, the XL-80 laser and optics can also be placed directly on a granite table (without tripod stage) for coordinate measuring machine (CMM) calibration.

The tripod and tripod case together weigh just 6.2 kg, to complement the portability of the rest of the laser system.

A 'quick fit/release' mechanism enables rapid and secure fixing to the tripod. For those applications where tripod mounting is not convenient, e.g. for mounting directly on a machine tool table, the stage and laser can also be mounted on most standard magnetic bases, using an optional adapter with M8 thread.
Software packages

Powerful software and clear but extensive support documentation are key to releasing the potential of the XL-80 system.

LaserXL™ software includes modules for linear, angular, rotary axis, flatness, straightness and squareness measurements, as well as dynamic measurement capability (see below). Users can select from English or a choice of several main languages for LaserXL™, QuickViewXL™ and system manual.

Standard report options conform to many international machine performance checking standards, such as ISO, ASME, VDI, JIS and GB, and include a comprehensive Renishaw analysis.

The dynamic measurement facility allows the collection of data at rates of 10 Hz to 50 kHz (at 12 preset values) and provides displacement, velocity and acceleration data. There’s even an integrated FFT package for frequency analysis.

With optional linear error compensation packages, the data obtained from a LaserXL™ calibration can be used to create compensation values for use in a CNC machine’s controller. This can significantly improve a machine’s positioning accuracy. Compensation packages are available to interface with many of today’s machine controllers.

Live, real-time display of laser measurement data for linear displacement, velocity and acceleration analysis. QuickViewXL™ provides the ideal tool for R&D, as it enables quick and easy investigation, review and characterisation of motion systems.

Both software packages are Windows® XP (SP2 and later) and Vista™ operating systems compatible (32-bit only).

Correct PC specification is vital for system performance. Please check with Renishaw for latest details.

Support packages

A multi-lingual system manual is supplied on CD with each laser system. This contains written and illustrated set-up procedures for each measurement, calibration tips and analysis information. It can be installed to your PC and accessed directly using the software Help button or used as a stand-alone reference.

Extra CDs are available free of charge.
Without reliable and accurate wavelength compensation errors of 20 ppm - 30 ppm would be common

Great effort has been taken to ensure Renishaw's XC-80 compensation system and sensors are accurate across the entire operating range of the system. It is this that maintains ±0.5 ppm linear measurement accuracy from 0 °C - 40 °C (32 °F - 104 °F) and over the full air pressure range (see graph comparisons with competitor system below).

Performance specifications are verified to international procedures against a documented system error budget, with system accuracy quoted to 95% confidence level (k = 2). (see page 11, System performance).
Easy to use and quick to set-up, the XL-80 allows users to reduce waiting time and increase available measurement time.

- Short preheat time (below six minutes)
- Laser and stage designed for combined storage
- Stage features quick release tripod mounting

Flexibility and ease of operation
- ‘Switchable’ between standard (40 m) and long (80 m) range modes
- An analogue I/O port allows for analogue and quadrature signal outputs (factory specified option) and a trigger signal input
- Easy to read LEDs for status and signal strength indication
- Uses standard or cordless mouse as trigger for remote manual data capture

Portability and handling
The small size of the XL-80 laser and XC-80 compensator means that the whole system (less tripod) can now be packed into a truly portable “wheelie-case”. A complete linear system in its case weighs around 12 kg. Even with the optional angular optics, accessories and a Renishaw QC10 ballbar kit (see page 10) it weighs just over 16 kg; a highly portable ‘check and correct’ system that others just can’t match.

Base system case takes full linear and angular system
System ‘wheelie-case’ and additional tripod case are truly portable

Base system (left) and full system (right) cases
Quality in design, build and technical support are Renishaw hallmarks. That’s vital, whether you’re dealing in microinches or nanometres

Design

Renishaw’s laser design and manufacturing operations are accredited to ISO 9001:2008 and are subject to regular third party audits. Products are developed in line with rigorous in-house procedures and guidelines, with extensive checks and reviews at each stage.

The system design is based on extensive feedback from laser and non-laser users to design out current system limitations and design in expected future requirements. The XL-80 is designed to allow updates and developments as user requirements change in the future.

The performance of Renishaw laser systems has been independently verified by National Physical Laboratory (NPL), UK and Physikalisch-Technische Bundesanstalt (PTB), Germany.

Build

Renishaw is big enough to produce nearly all components and assemblies in its own factories.

It has an extensive and modern machine shop, surface finishing and software departments. There’s even a complete PCB design, build and test facility.

This in-house manufacture, together with design, gives Renishaw the capability to fully understand and control the design and build process, unlike suppliers who outsource these activities.
Test and certification

All XL-80 and XC-80 systems (including sensors) are delivered with comprehensive calibration certificates giving test data in both tabular and graphical format, as well as full details of calibration standards used and of traceability to international standards.

Separate laser and sensor certification allows you to interchange components whilst maintaining traceable accuracy.

Support

Renishaw sales engineers are renowned for their pre and post sales support. We know that buying a laser system is a major investment for you and your company. Please ask us if you have any questions, we’ve nothing to hide and we want you to be sure you choose the right solution for your application.

To ensure ongoing performance, Renishaw offers a full in-house recalibration service for components and systems. Alternatively, third party calibration is available from various national standards laboratories including NPL, PTB and NIM (China).

Your guarantee

With extensive in-house manufacturing and years of experience, Renishaw has the confidence to offer a 3 year system warranty as standard. An extension to 5 years is available for a small price premium (please ask for details).

Ballbar and laser, working together for maximum benefit

The Renishaw QC10 ballbar system is internationally recognised as the ideal solution to quickly check machine tools and is ideal for use in between scheduled laser calibrations.

Recognising this, both the XL system cases will accept an optional tray to securely hold all standard QC10 kit components.

This provides a portable ‘check and correct’ system that others just cannot match.
**XL-80 laser system: main specifications**

### Laser head XL-80
- **Dimensions (weight):** 214 mm x 120 mm x 70 mm (1.85 kg)
- **Power supply:** External, 90 V AC - 264 V AC, auto sensing
- **System measurement capability:** Linear, angular (and rotary), flatness, straightness and squareness
- **Laser output:**
  - Interface: Integral USB comms, no separate interface
  - TPin (trigger signal): Yes
  - Quadrature signal output: Yes (factory option)
  - Analogue voltage output: Yes
  - Signal strength LEDs: Yes

**Your XL laser is supplied as a kit including:**
- XL laser unit (with standard shutter)
- USB cable
- Power supply and cables
- Aux I/O connector
- System manual (CD-ROM)

### Environmental compensator XC-80
- **Dimensions (weight):** 135 mm x 58 mm x 52 mm (490 g)
- **Power supply:** Powered via USB from PC
- **Internal sensors:** Air pressure, Relative humidity
- **Remote sensors:** 1 air temperature, 1 - 3 material temperature
- **Interface:** Integral USB comms, no separate interface

**Your XC compensator is supplied as a kit including:**
- XC compensator unit
- Air temperature sensors kit
- Material temperature sensor kit
- USB cable
- System manual (CD-ROM)

### System cases and tripod

** 20 MHz in quadrature mode

### Other

- **Warranty:** 3 years (with 5 year option)
- **Certification:** XL, XC, air and material temperature sensors. Certificates comply with requirements of ISO 17025.
- **Quality system:** ISO 9001, BSI certified
Measurement optics

The XL-80 system uses the same range of optics as Renishaw’s ML10 system, covering linear, angular (including rotary axes), straightness, squareness and flatness measurements. All measurements are interferometric and therefore use the traceable international standard wavelength of laser light.

Optics accessories

LS350 beam steerer
This unique patented optic provides easy angular adjustment of the laser beam in both horizontal and vertical planes, making laser alignment a simple one step process. The beam steerer speeds up linear, angular and straightness measurements, whether in-line or at 90°. The optic is also compatible with the linear/angular combination kit and swivel/fixed turning mirrors. Clamping screws allow the beam steerer to be easily attached to measurement optics.

<td>0 ft – 33 ft</td>
</tr>
</tbody>
</table>

Swivel mirror
This mirror can be used as an alignment aid for ANSI B5.54 diagonal measurements. It is also useful when measuring slant-bed lathes. Clamping screws allow the mirror to be easily attached to measurement optics.

Fixed turning mirror
This mirror reflects the laser beam through 90°. Like the swivel mirror, it can be attached to the measurement optics to aid optical set-up and is used primarily when there is restricted access to the required axis of measurement.

About Renishaw

Renishaw is an established world leader in engineering technologies, with a strong history of innovation in product development and manufacturing. Since its formation in 1973, the company has supplied leading-edge products that increase process productivity, improve product quality and deliver cost-effective automation solutions.

A worldwide network of subsidiary companies and distributors provides exceptional service and support for its customers.

Products include:

- Dental CAD/CAM scanning and milling systems
- Encoder systems for high accuracy linear, angle and rotary position feedback
- Laser and ballbar systems for performance measurement and calibration of machines
- Medical devices for neurosurgical applications
- Probe systems and software for job set-up, tool setting and inspection on CNC machine tools
- Raman spectroscopy systems for non-destructive material analysis
- Sensor systems and software for measurement on CMMs (co-ordinate measuring machines)
- Styli for CMM and machine tool probe applications
